

Applications

High Efficiency 33V, 4A, 1MHz Step Up Regulator

General Description

The SY7304 is a high efficiency, current-mode control Boost regulator. The device integrates a 120mΩ low $R_{DS(ON)}$ N-channel MOSFET for high efficiency. The fixed 1MHz switching frequency and internal compensation reduce external components size and count. The build-in internal soft start circuitry minimizes the inrush current at start-up. The SY7304 is available in compact DFN3×3-10 package.

Ordering Information

Ordering Number	Package type	Note
SY7304DBC	DFN3×3-10	4A

Features

- Wide input range: 3-33V
- Maximum output voltage: 33V
- 1MHz switching frequency
- Integrated 120 mΩ $R_{DS(ON)}$ switch with 4A peak current capability
- Internal soft-start
- 0.6V ± 2% reference voltage
- Cycle by cycle peak current limit
- Over temperature protection
- RoHS Compliant and Halogen Free
- Compact package: DFN3×3-10

Applications

- Portable Device
- Battery Powered System
- Networking cards powered from PCI or PCI-express slots

Typical Applications

Figure 1. Schematic Diagram

Pinout (top view)

(DFN3×3-10)

Top Mark: VLxyz (Device code: VL, x=*year code*, y=*week code*, z=*lot number code*)

Pin Name	Pin Number	Pin Description
IN	7	Input pin. Decouple this pin to GND pin with 1uF ceramic cap.
GND	11	Ground pin
LX	4,5	Inductor node. Connect an inductor between IN pin and LX pin.
FB	2	Feedback pin. Connect a resistor R1 between V _{OUT} and FB, and a resistor R2 between FB and GND to program the output voltage: V _{OUT} =0.6V*(R1/R2+1).
EN	9	Enable control. High to turn on the part. Don't leave it floated.
NC	1,3,6,8,10	No connection.

Absolute Maximum Ratings (Note 1)

LX, IN, EN----- -0.3V to 36V

FB----- -0.3V to 4V

Power Dissipation, P_D @ T_A = 25°C DFN3×3-10----- -2.6W

Package Thermal Resistance (Note 2)

θ_{JA}-----38°C/W

θ_{JC}-----8°C/W

Junction Temperature Range-----40 to 150°C

Lead Temperature (Soldering, 10 sec.)-----260°C

Storage Temperature Range-----65°C to 150°C

Dynamic LX voltage in 50ns duration----- IN+3V to GND-4V

Recommended Operating Conditions (Note 3)

IN----- V to 33V

Junction Temperature Range-----40°C to 125°C

Ambient Temperature Range-----40°C to 85°C

Electrical Characteristics

($V_{IN} = 5V$, $V_{OUT} = 12V$, $I_{OUT} = 100mA$, $T_A = 25^\circ C$ unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Input Voltage Range	V_{IN}		3		33	V
Quiescent Current	I_Q	$V_{FB} = 0.66V$		100		μA
Shutdown Current	I_{SHDN}	EN=0			15	μA
Low Side Main FET R_{ON}	$R_{DS(ON)}$			120		m Ω
Main FET Current Limit	I_{LIM}	Duty cycle=80%	4		6	A
Switching Frequency	Fsw		0.8	1	1.2	MHz
Feedback Reference Voltage	V_{REF}		0.588	0.6	0.612	V
FB Pin Input Current	I_{FB}		-50		50	nA
IN UVLO Rising Threshold	$V_{IN,UVLO}$				2.7	V
UVLO Hysteresis	$U_{VLO,HYS}$			0.1		V
EN Rising Threshold	V_{ENH}		2			V
EN Falling Threshold	V_{ENL}				0.4	V
Max Duty Cycle	Dmax			90		%
Thermal Shutdown Temperature	T_{SD}			150		$^\circ C$
Thermal Recovery Hysteresis	T_{HYS}			15		$^\circ C$

Note 1: Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2: θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective single layer thermal conductivity test board of JEDEC 51-3 thermal measurement standard. Test condition: Device mounted on 2” x 2” FR-4 substrate PCB, 2oz copper, with minimum recommended pad on top layer and thermal vias to bottom layer ground plane.

Note 3: The device is not guaranteed to function outside its operating conditions.

Typical Performance Characteristics

Applications Information

Because of the high integration in SY7304, the application circuit based on this regulator IC is rather simple. Only input capacitor C_{IN} , output capacitor C_{OUT} , inductor L and feedback resistors (R_1 and R_2) need to be selected for the targeted applications.

Feedback resistor divider R_1 and R_2

Choose R_1 and R_2 to program the proper output voltage. To minimize the power consumption under light load, it is desirable to choose large resistance values for both R_1 and R_2 . A value between 10k and 1M is recommended for both resistors. If $R_1=200k$ is chosen, then R_2 can be calculated to be:

$$R_2 = \frac{0.6R_1}{V_{OUT} - 0.6} (\Omega)$$

Input capacitor C_{IN}

The ripple current through input capacitor is calculated as:

$$I_{CIN_RMS} = \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{2\sqrt{3} \cdot L \cdot F_{SW} \cdot V_{OUT}} (A)$$

To minimize the potential noise problem, place a typical X5R or better grade ceramic capacitor really close to the IN and GND pins. Care should be taken to minimize the loop area formed by C_{IN} , and IN/GND pins. A low ESR ceramic capacitor with greater than 10uF capacitance is recommended.

Output capacitor C_{OUT}

The output capacitor is selected to handle the output ripple noise requirements. Both steady state ripple and transient requirements must be taken into account when selecting this capacitor. For the best performance, it is recommended to use X5R or better grade ceramic capacitor with greater than 22uF capacitance.

Boost inductor L

There are several considerations in choosing this inductor.

- 1) Choose the inductance to provide the desired ripple current. It is suggested to choose the ripple current to be about 40% of the maximum average input current. The inductance is calculated as:

$$L = \left(\frac{V_{IN}}{V_{OUT}} \right) \frac{(V_{OUT} - V_{IN})}{F_{SW} \times I_{OUT_MAX} \times 40\%}$$

where F_{SW} is the switching frequency and I_{OUT_MAX} is the maximum load current.

SY7304 regulator IC is less sensitive to the ripple current variations. Consequently, the final choice of inductance can be slightly off the calculation value without significantly impacting the performance.

- 2) The saturation current rating of an inductor must be selected to guarantee an adequate margin to the peak inductor current under full load conditions.

$$I_{SAT_MIN} > \left(\frac{V_{OUT}}{V_{IN}} \right) \times I_{OUT_MAX} + \left(\frac{V_{IN}}{V_{OUT}} \right) \frac{(V_{OUT} - V_{IN})}{2 \times F_{SW} \times L}$$

- 3) The DCR of the inductor and the core loss at the switching frequency must be low enough to achieve the desired efficiency requirement. It is desirable to choose an inductor with $DCR < 10m\Omega$ to achieve a good overall efficiency.

Enable Operation

Pulling the EN pin low (<0.4V) will shut down the device. During the shut down mode, the SY7304 shut down current drops to lower than 15uA. Driving the EN pin high (>2V) will turn on the IC again.

Rectifier Diode Selection

Schottky diode is a good choice for high efficiency operation because of its low forward voltage drop and fast reverse recovery. The maximum current rating of the diode must be higher than maximum input current. And the average current rating of the diode must be higher than the output current.

Layout Design

The layout design of SY7304 regulator is highly simplified. To achieve a higher efficiency and better noise immunity, following components should be placed close to the IC: C_{IN} , L , R_1 and R_2 .

- 1) It is desirable to maximize the PCB copper area connecting to GND pin to achieve better thermal

performance and noise immunity. If the board space allowed, a designated ground plane layer is highly recommended.

2) C_{IN} must be close to IN and GND pins. The loop area formed by C_{OUT} , LX and GND pins must be minimized.

3) The PCB copper area associated with LX pin must be minimized to improve the noise immunity.

4) The components R_1 and R_2 , and the trace connecting to the FB pin must NOT be adjacent to the LX node on the PCB layout to minimize the noise coupling to FB pin.

5) If the system chip interfacing with the EN pin has a high impedance state at shutdown mode and the IN pin is connected directly to a power source such as a Li-Ion battery, it is desirable to add a pull down $1M\Omega$ resistor across the EN and GND pins to prevent the noise from falsely turning on the regulator at shutdown mode.
