

ME78L05

3-Terminal Positive Voltage Regulator ME78L05

General Description

ME78L05 is three-terminal positive regulators. One of these regulators can deliver up to 100 mA of output current. The internal limiting and thermal -shutdown features of the regulator make them essentially immune to overload. When used as a replacement for a zener diode-resistor Combination, an effective improvement in output impedance can be obtained, together with lower quiescent current.

Features

- Output Current of 100mA
- •Output Voltages of 5V±5% over the temperature range
- •Thermal Overload Protection
- Short Circuit Protection
- •Output transistor safe area protection
- No external components
- Package: SOT89-3 and TO92(Taping Package)

Block Diagram

Maximum Ratings(Ta=25°C)

Maximum Natings(1a=25 C)			
Parameter	Rating	Unit	
Input supply voltage : VIN	30	V	
MAX. Output current:lout	100	mA	
Max Power:Pmax	0.35	W	
Maximum junction temperature: T _j	<i>-</i> 25∼125	$^{\circ}\!\mathrm{C}$	
Storage temperature :T _{str}	- 55∼150	°C	
Soldering temperature and time	+260 (Recommended 10S)	°C	

Caution: The absolute maximum ratings are rated values exceeding which the product could suffer physical damage.

These values must therefore not be exceeded under any conditions.

Electrical Characteristics

(Cin =0.33 μ F, Co =0.1 μ F,0 \leq Tj \leq 125 $^{\circ}$ C, unless otherwise noted)

Parameter	Symbol	Conditions	Min.	Тур.	Max.	Unit
		I _O =40mA, VIN=10V	4.82	5.0	5.18	
Output Voltage	Vo	I _O =1mA~40mA VIN=7V~20V	4.8	5.0	5.2	V
		I _O =1mA~10mA VIN=10V	4.75	5.0	5.25	
Line Regulations	I NID	VIN=7V \sim 20V, I_0 =40mA	-150	-	150	mV
Line Regulations	LINK	UN=8V~20V,I _O =40mA -100	-100	-	100	IIIV
Load Regulation	LDR	VIN=10V,I _O =1mA-100mA	-60	-	60	mV
Load Negulation		VIN=10V,I _O =1mA-40mA	-30	-	30	
Dropout Voltage	V_{DIF}	Tj=25 ^o C,lo=100mA	-	2	-	V
Output noise Voltage	V_N	f=10Hz to 100KHz	-	40	-	μV/Vo
Ripple Rejection	PSRR	Tj=25 ^O C, $f=120$ Hz, $Io=40$ mA VIN=8V \sim 20V	-	80	-	dB
Peak Output Current	I_pk	Tj=25 ^o C	-	500	-	mA
Quiescent Current	<u>-</u> Q	VIN=10V,I _{OUT} =40mA	-	-	5.5	mA
Quiescent Current	escent Current Change	VIN=8V \sim 20V,I $_{0}$ =40mA	-1.5	-	1.5	mA
Change		VIN=10V, I_0 =1mA \sim 40mA,	-0.1	-	0.1	IIIA

LNR: Line Regulation. The change in output voltage for a change in the input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that the average chip temperature is not significantly affected.

LDR: Load Regulation. The change in output voltage for a change in load current at constant chip temperature.

ME78L05 is designed with Thermal Overload Protection that shuts down the circuit when subjected to an excessive power overload condition, Internal Short Circuit Protection that limits the maximum current the circuit will pass, and Output Transistor Safe-Area Compensation that reduces the output short circuit current as the voltage across the pass transistor is increased.

In many low current applications, compensation capacitors are not required. However, it is recommended that the regulator input be bypassed with a capacitor if the regulator is connected to the power supply filter with long wire lengths, or if the output load capacitance is large. An input bypass capacitor should be selected to provide good high frequency characteristics to insure stable operation under all load conditions. A 0.33µFor larger tantalum, mylar, or other capacitor having low internal impedance at high frequencies should be chosen. The bypass capacitor should be mounted with the shortest possible leads directly across the regulator's input terminals. Normally good construction techniques should be used to minimize ground loops and lead resistance drops since the regulator has no external sense lead.

Typical Application Circuit

Fig.1 Fixed Output Regulator

A common ground is required between the input and the output voltages. The input voltage must remain typically 2.0 V above the output voltage even during the low point on the input ripple voltage.

- •Cin is required if regulator is located an appreciable distance from power supply filter.
- •Co is not needed for stability; however, it does improve transient response.

Fig.2 Constant Current Regulator

The ME78L05 regulatorcan also be used as a current source when connected as Fig.2. In order to minimize dissipation the ME78L05 is chosen in this application. Resistor R determines the current as follows:

$$I_{O} = \frac{5V}{R} + I_{Q}$$

Fig.3 Adjustable Output Regulator

 $Vo=5V+5V/R1+I_{O})*R2$
