

## High Efficiency Boost DC/DC Regulator

## **GENERAL DESCRIPTION**

The PW5200A/ PW5200C is high efficiency synchronous, PWM step-up DC/DC converters optimized to provide a high efficient solution to medium power systems. The devices work with a 1.4MHz fixed frequency switching. These features minimize overall solution footprint by allowing the use of tiny, low profile inductors and ceramic capacitors. Automatic PWM/PFM mode switching at light load saves power and improves efficiency.

The PW5200A/ PW5200C is capable of supplying an output voltage between 2.5V and 5V, the internal synchronous switch is desired to provide high efficiency without Schottky.

## **FEATURES**

- Up to 94% Efficiency
- Shut-down Current: <1μA</li>
- Load Current: up to 500mA
- Input Voltage: PW5200A: 1V to 4.4V, PW5200C: 2V to 4.4V
- Output Voltage: 2.5V to 5V (up to 5V with Schottky)
- Low Switch On Resistance RDS(ON), Internal Switch: 0.35Ω
- 1.4MHz Fixed Frequency Switching
- Automatic PWM/PFM Mode Switching
- Low Profile SOT-23-6L Package

# VIN PIN VIN PIN VIN PIN SW/LX PIN SW/LX PIN Minimize area R2 R1 FB PIN Close to FB Pin Undesired Desired

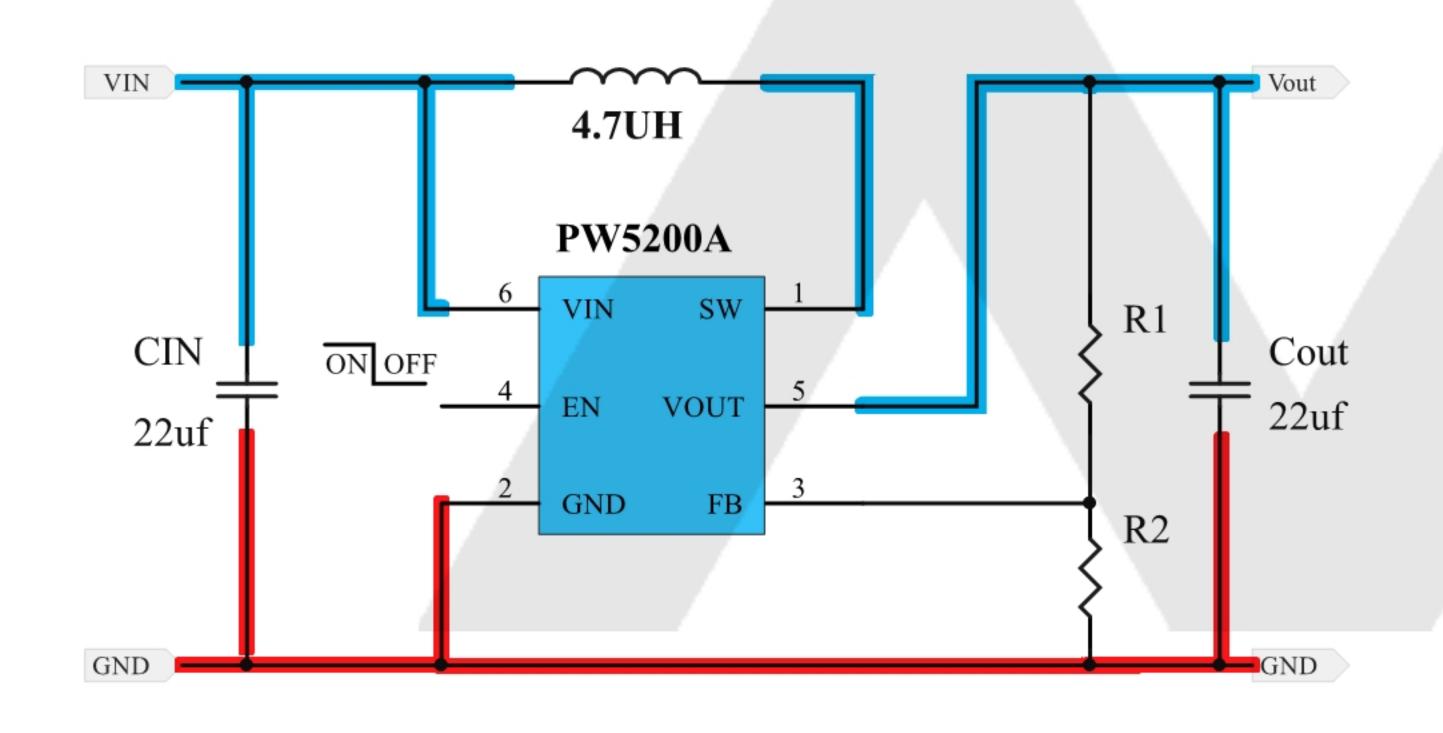

#### **APPLICATIONS**

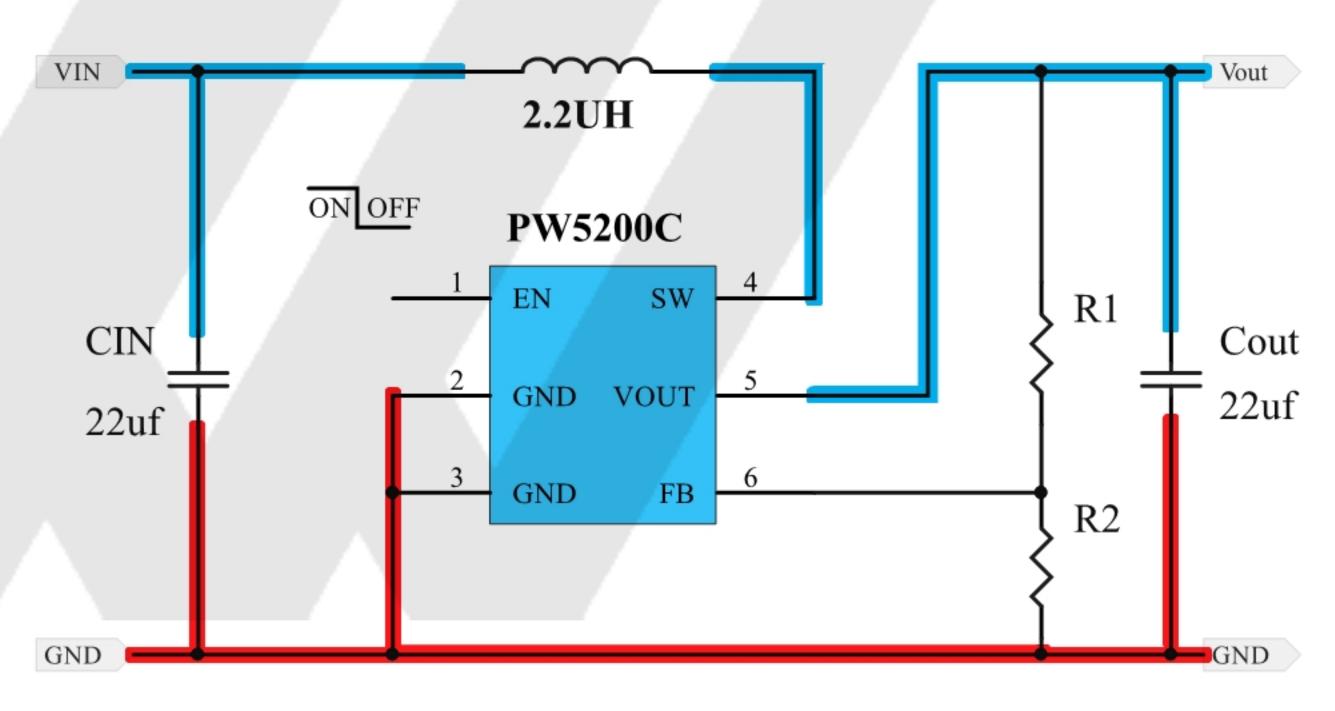

- Digital cameras and MP3
- Palmtop computers / PDAs
- Cellular phones
- Wireless handsets and DSL modems
- PC cards
- Portable media players

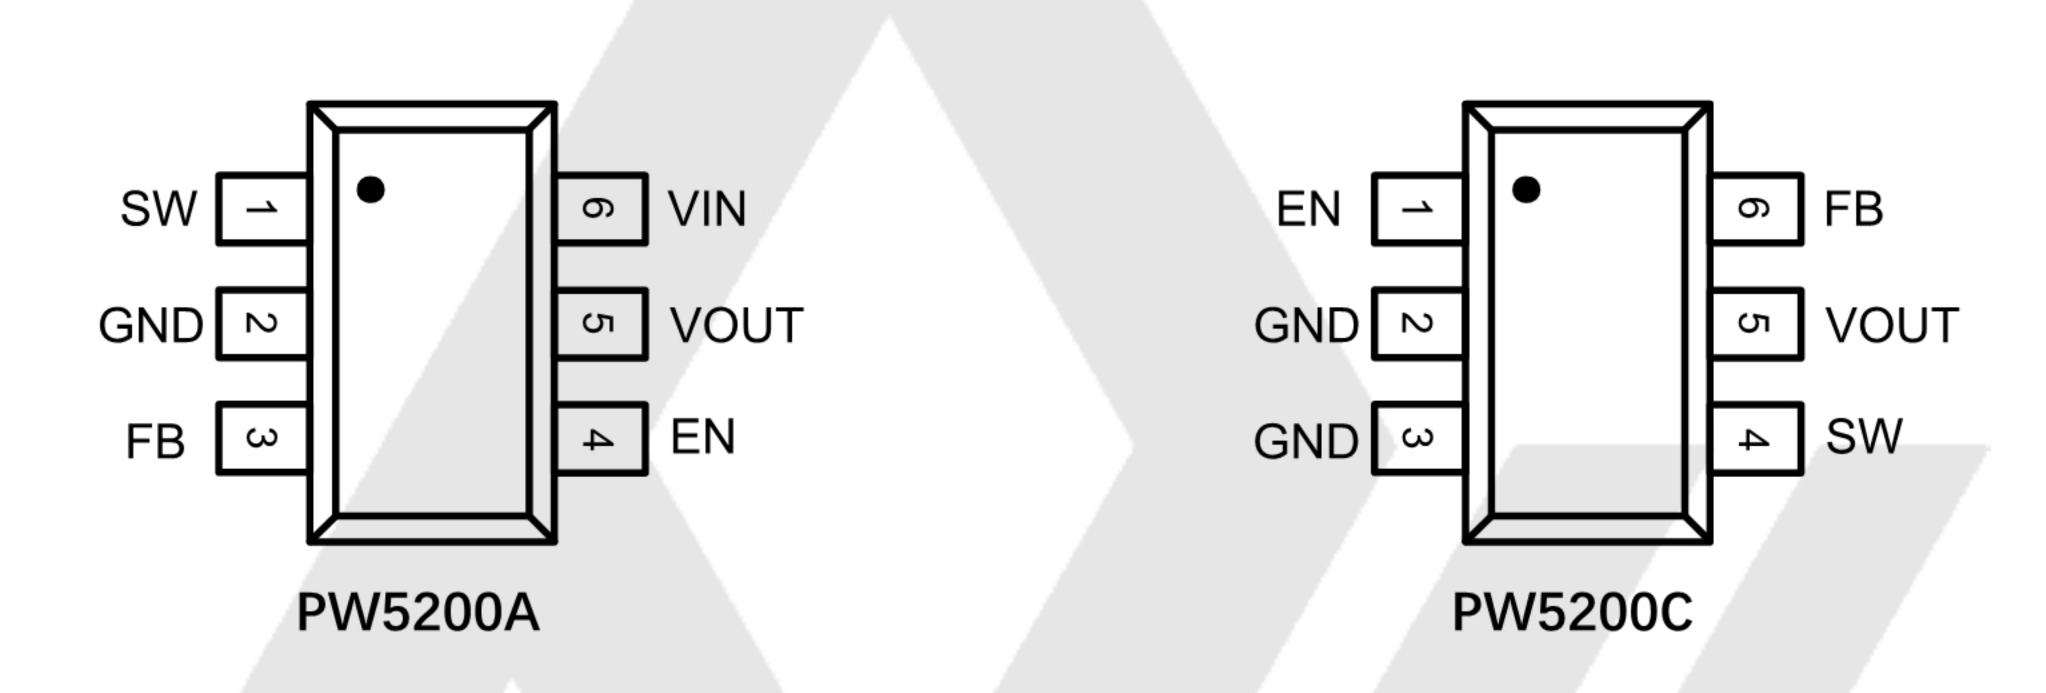

## TYPICAL APPLICATION CIRCUIT

# PIN ASSIGNMENT/DESCRIPTION

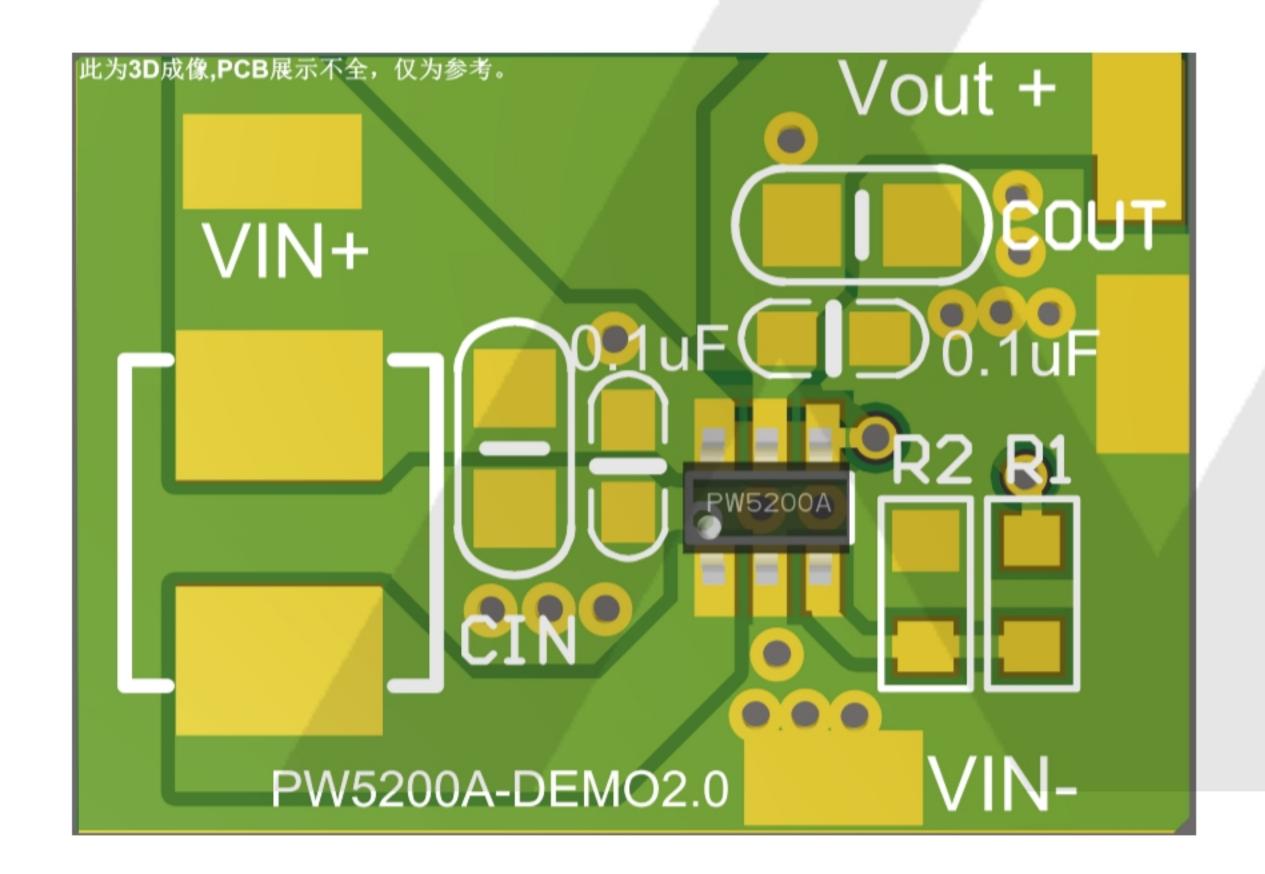

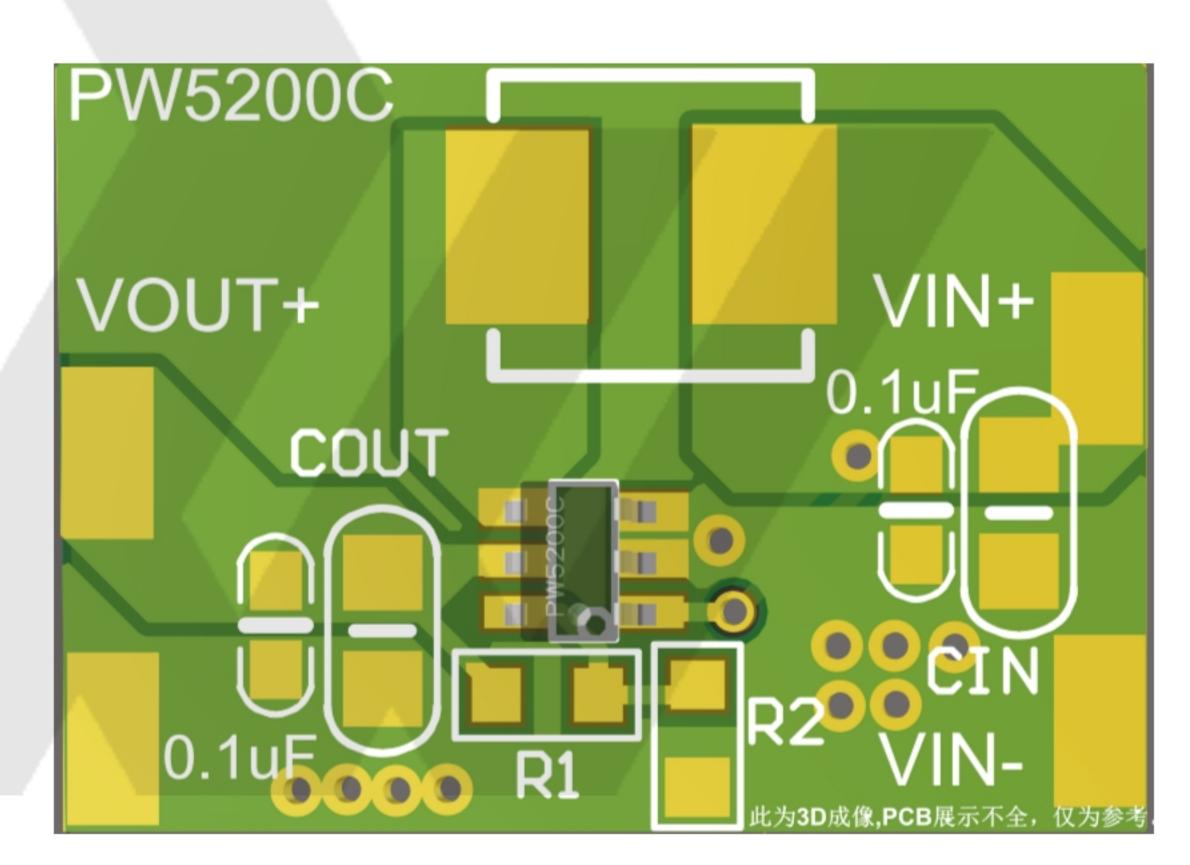

Pin Name	Function
	Logic Controlled Shutdown Input. EN = High: Normal free running operation,
EN	1.4MHz typical operating frequency. EN = Low: Shutdown, quiescent current $<1\mu A$ .
	Output capacitor can be completely discharged through the load or feedback
	resistors.
GND	Signal and Power Ground. Provide a short direct PCB path between GND and the
UIND	(–) side of the output capacitor(s).
SW	Switch Pin. Connect inductor between SW and VIN. Keep these PCB trace lengths
J V V	as short and wide as possible to reduce EMI and voltage overshoot.
VOUT	Output Voltage Pin. PCB trace length from VOUT to the output filter capacitor(s)
V O O 1	should be as short and wide as possible.
	Feedback Input to the gm Error Amplifier. Connect resistor divider tap to this pin.
FB	The output voltage can be adjusted from 2.5V to 5V by:
ГБ	$\left(\frac{R1}{R2} + 1\right) * 1.212V = Vout$
	Battery Input Voltage. The device gets its start-up bias from VIN. Once VOUT
\	exceeds VIN, bias comes from VOUT. Thus, once started, operation is completely
VIN	independent from VIN. Operation is only limited by the output power level and the
	battery's internal series resistance.

# **PCB Layout Guidelines**

The high speed operation of the PW5200A/ PW5200C demands careful attention to board layout. You will not get advertised performance with careless layout. A large ground pin copper area will help to lower the chip temperature. A multilayer board with a separate ground plane is ideal, but not absolutely necessary. Recommended component placement: traces carrying high current are direct. Trace area at FB pin is small. Lead length to battery is short.

### Recommended Layout

# Absolute Maximum Ratings (note1)

Parameter	VALUE	Unit	
\	PW5200A	0.2 5	V
VIN	PW5200C	-0.3 ~ 5	
Vout		-0.3 ~ 6.6	V
Vsw		-0.3 ~ 6.6	V
VEN		-0.3 ~ 6.6	V
Operating Temperature Ra	-40 ~ +85	°C	
Junction Temperature	-40 ~ +125	°C	
Storage Temperature Rang	-65 ~ +150	°C	
Lead Temperature (Solderi	+265	°C	

**Note 1:** Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device

reliability.

**Note 2:** The PW5200A/ PW5200C is guaranteed to meet performance specifications from 0°C to 70°C. Specifications over the –40°C to 85°C operating temperature range are assured by design, characterization and correlation with statistical process controls.

## ELECTRICAL CHARACTERISTICS

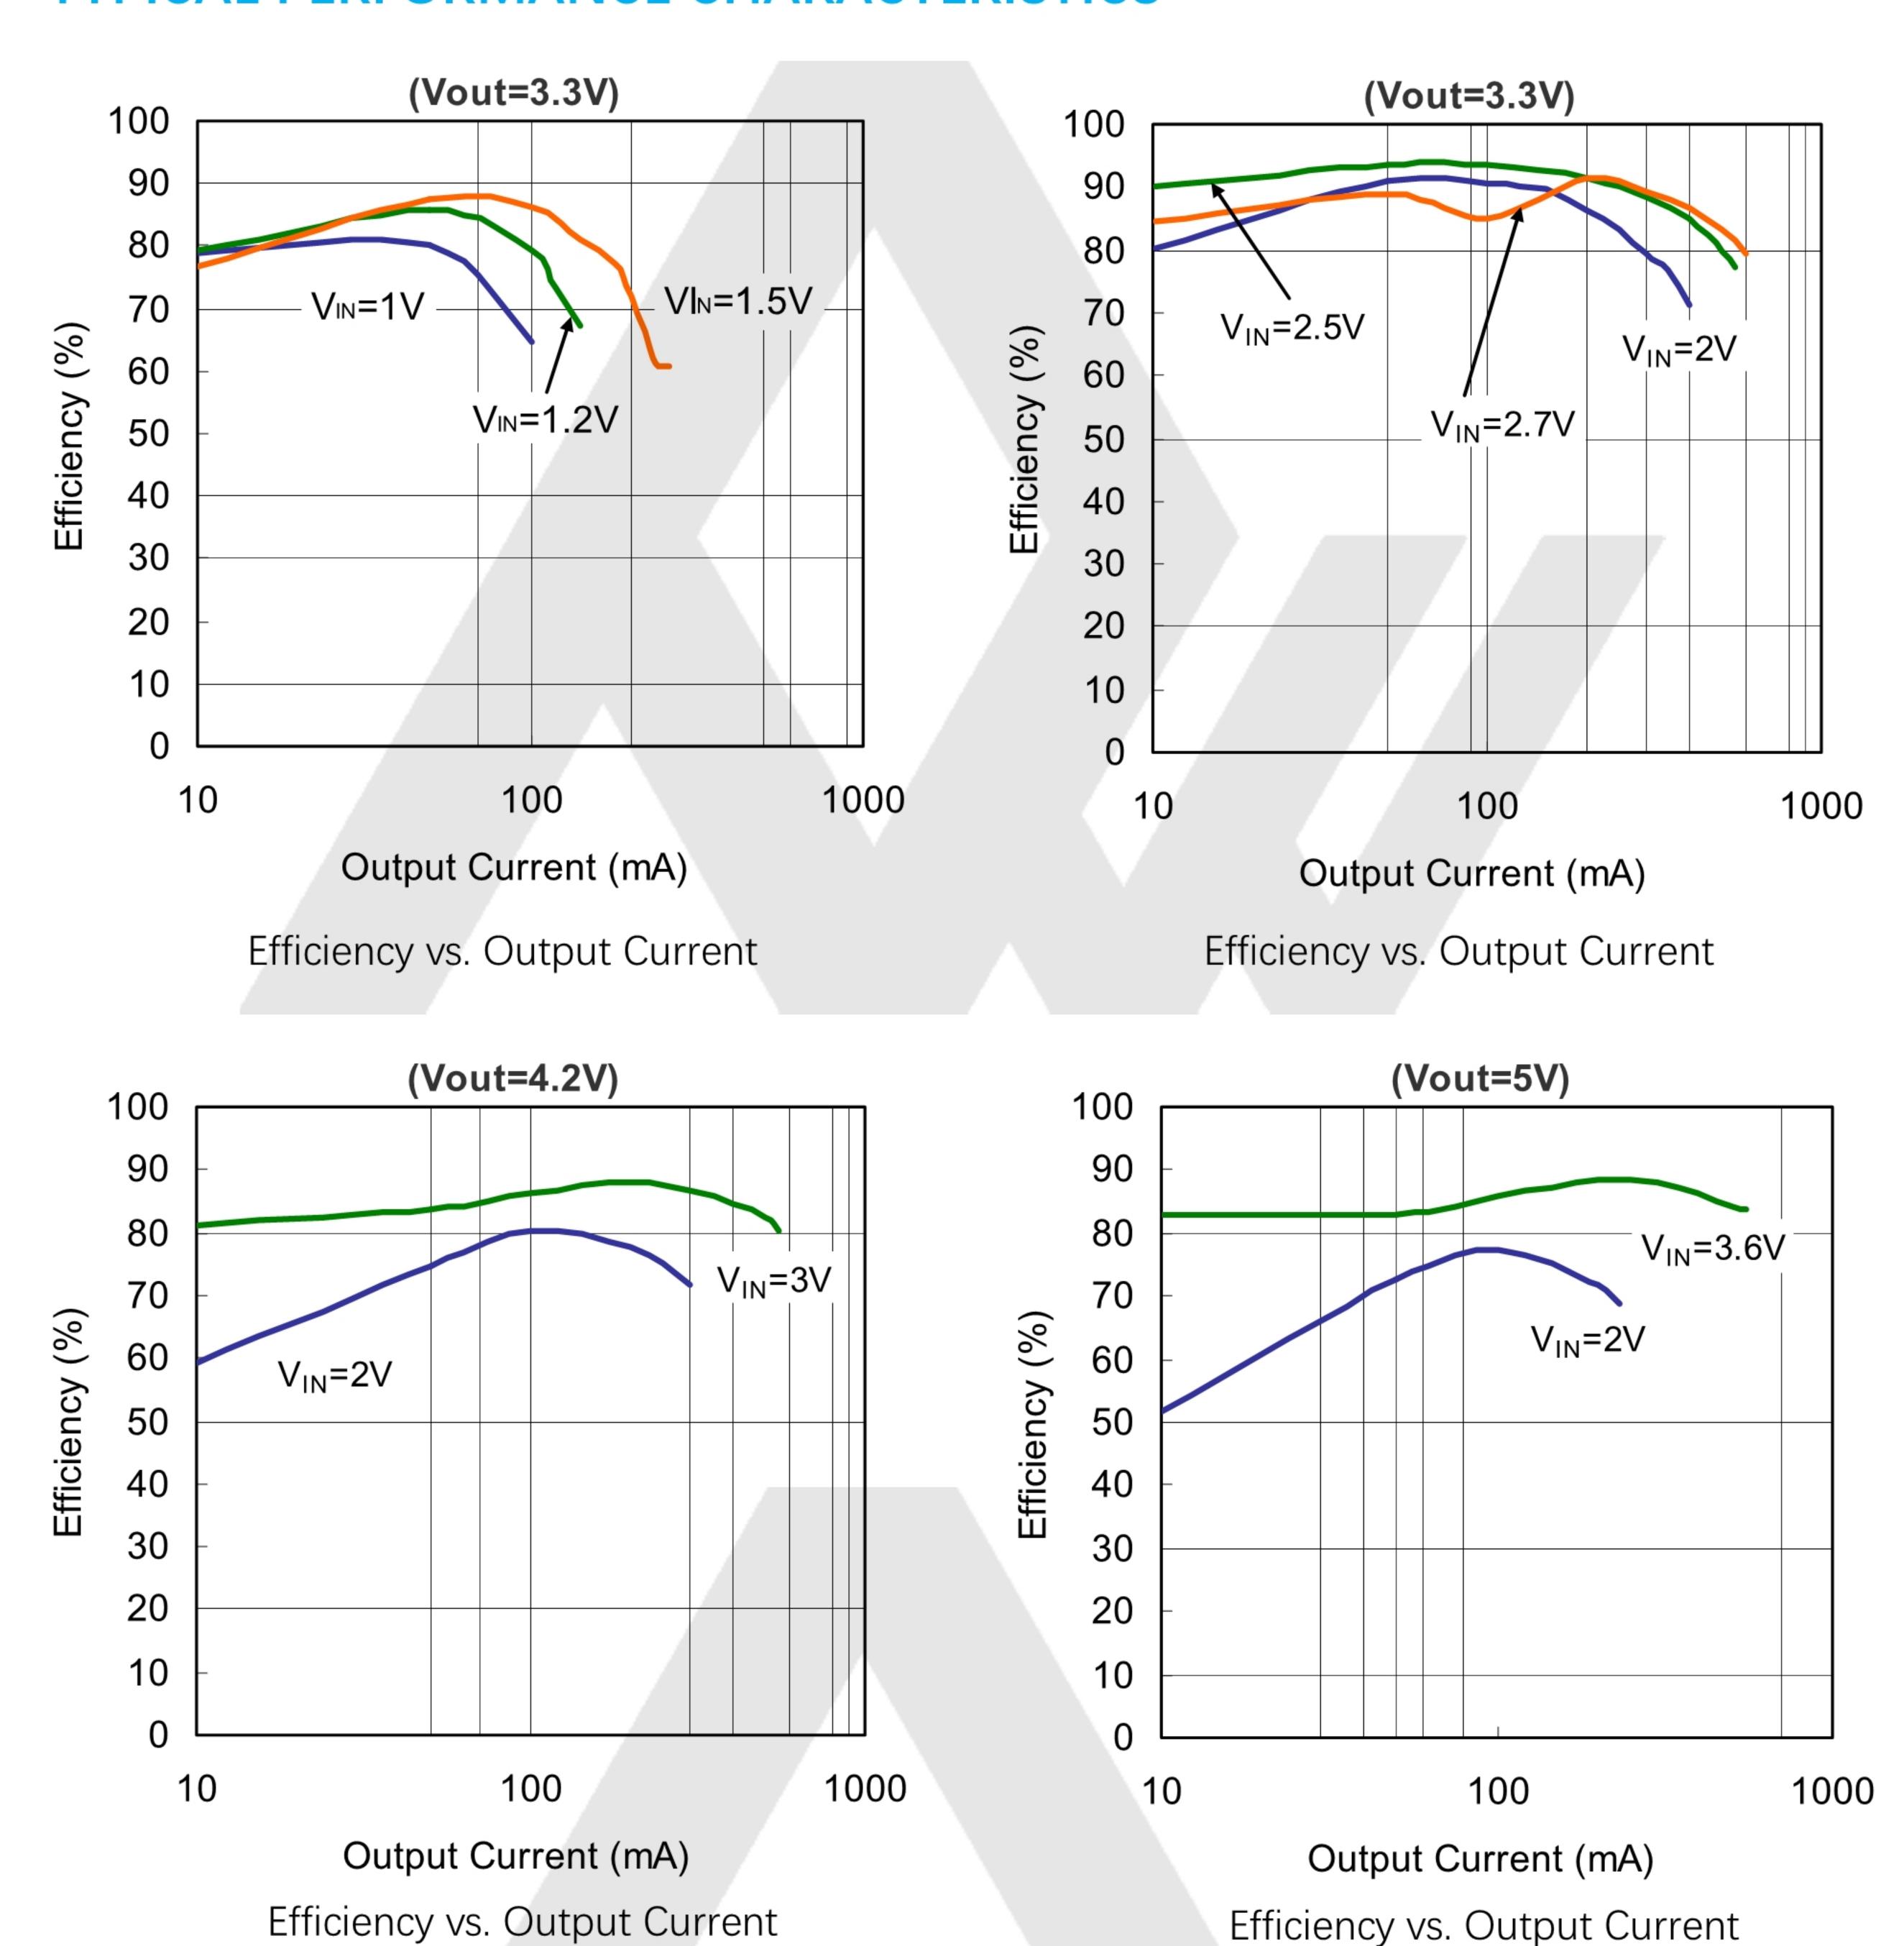

Operating Conditions: TA=25°C, VIN=1.2V, VOUT=3.3V, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS		MIN	TYP	MAX	UNITS
Vout	Output Voltage Range (Adj.)			2.5		5	V
VSTART	Minimum Start-up Voltage (Note 3)	ILOAD=	PW5200A		1	1.3	V
		1mA	PW5200C		2		
VMIN	Minimum Operating	VEN = \	/IN		0.6	0.75	V
IQ	Quiescent Current	For PW5200A, VIN=1.2V			260		μΑ
	Quicocciic Guireite	For PW5200C, VIN=2V			550		μΑ
Ishdn	Shutdown Current	VEN=0V,Including Switch Leakage			0.1	1	μΑ
VFB	Feedback Voltage			1.165	1.212	1.241	V
IFB	Feedback Input Current	Vfb = 1.22V			1		nA
fosc	Switching Frequency			1.1	1.4	1.7	MHz
DC	Max Duty Cycle	Vfb = 1.15V		80	87		%
Venh	En Input High			1			V
Venl	En Input Low					0.5	V
IEN	En Input Current	VEN = 5.5V			0.01	1	μΑ
ILIM-N	NMOS Current Limit			700	850		mA
ILK-N	NMOS Switch Leakage	Vsw = 5V			0.1	5	μΑ
ILK-P	PMOS Switch Leakage	Vsw = 0V			0.1	5	μΑ
Rnfet	NMOS Switch On Resistance	Vout = :	3.3V		0.35		Ω
RPFET	PMOS Switch On Resistance	Vout = 3.3V			0.45		Ω

Note 3: Minimum VIN operation after start-up is only limited by the battery's ability to provide the necessary power as it enters a deeply discharged state.

## TYPICAL PERFORMANCE CHARACTERISTICS

# **Application Information**

## Inductor Selection

The PW5200A/ PW5200C can utilize small surface mount and chip inductors due to their fast 1.4MHz switching frequency. A minimum inductance value of 2.2 $\mu$ H is necessary for 3.6V and lower voltage applications and 4.7 $\mu$ H for output voltages greater than 3.6V. Larger values by reducing the inductor ripple current. Increasing the inductance above 10 $\mu$ H will increase size while providing little improvement in output current capability.

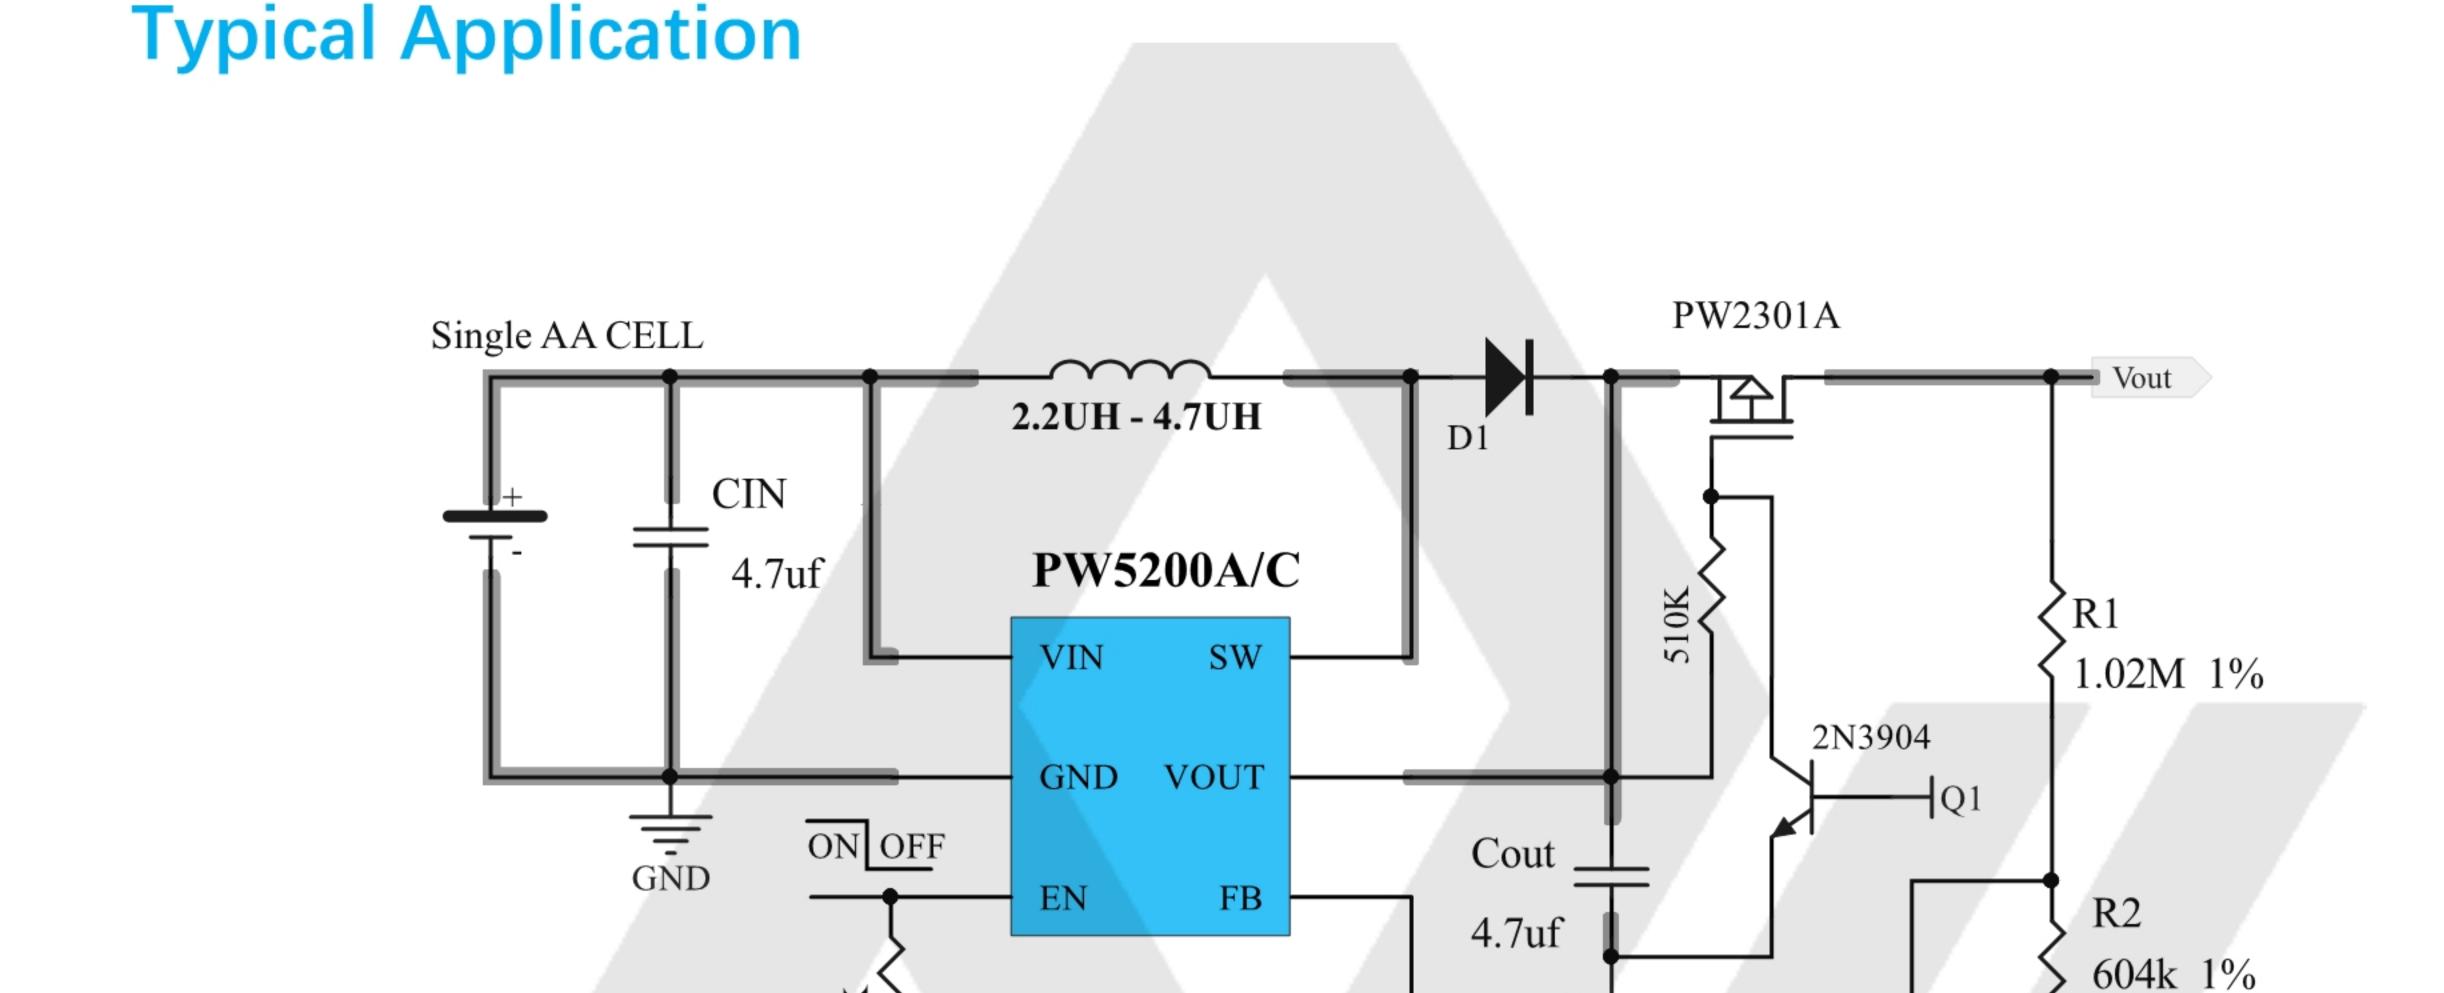

The inductor current ripple is typically set for 20% to 40% of the maximum inductor current (IP). High frequency ferrite core inductor materials reduce frequency dependent power losses compared to cheaper powdered iron types, improving efficiency. The inductor should have low ESR (series resistance of the windings) to reduce the I2R power losses, and must be able to handle the peak inductor current without saturating. Molded chokes and some chip inductors usually do not have enough core to support the peak inductor currents of 850mA seen on the PW5200A/ PW5200C. To minimize radiated noise, use a toroid, pot core or shielded bobbin inductor. See Table 1 for some suggested components and suppliers.

#### Output and Input Capacitor Selection

Low ESR (equivalent series resistance) capacitors should be used to minimize the output voltage ripple. Multilayer ceramic capacitors are an excellent choice as they have extremely low ESR and are available in small footprints. A  $4.7\mu F$  to  $15\mu F$  output capacitor is sufficient for most applications. Larger values up to  $22\mu F$  may be used to obtain extremely low output voltage ripple and improve transient response. An additional phase lead capacitor may be required with output capacitors larger than  $10\mu F$  to maintain acceptable phase margin. X5R and X7R dielectric materials are preferred for their ability to maintain capacitance over wide voltage and temperature ranges.

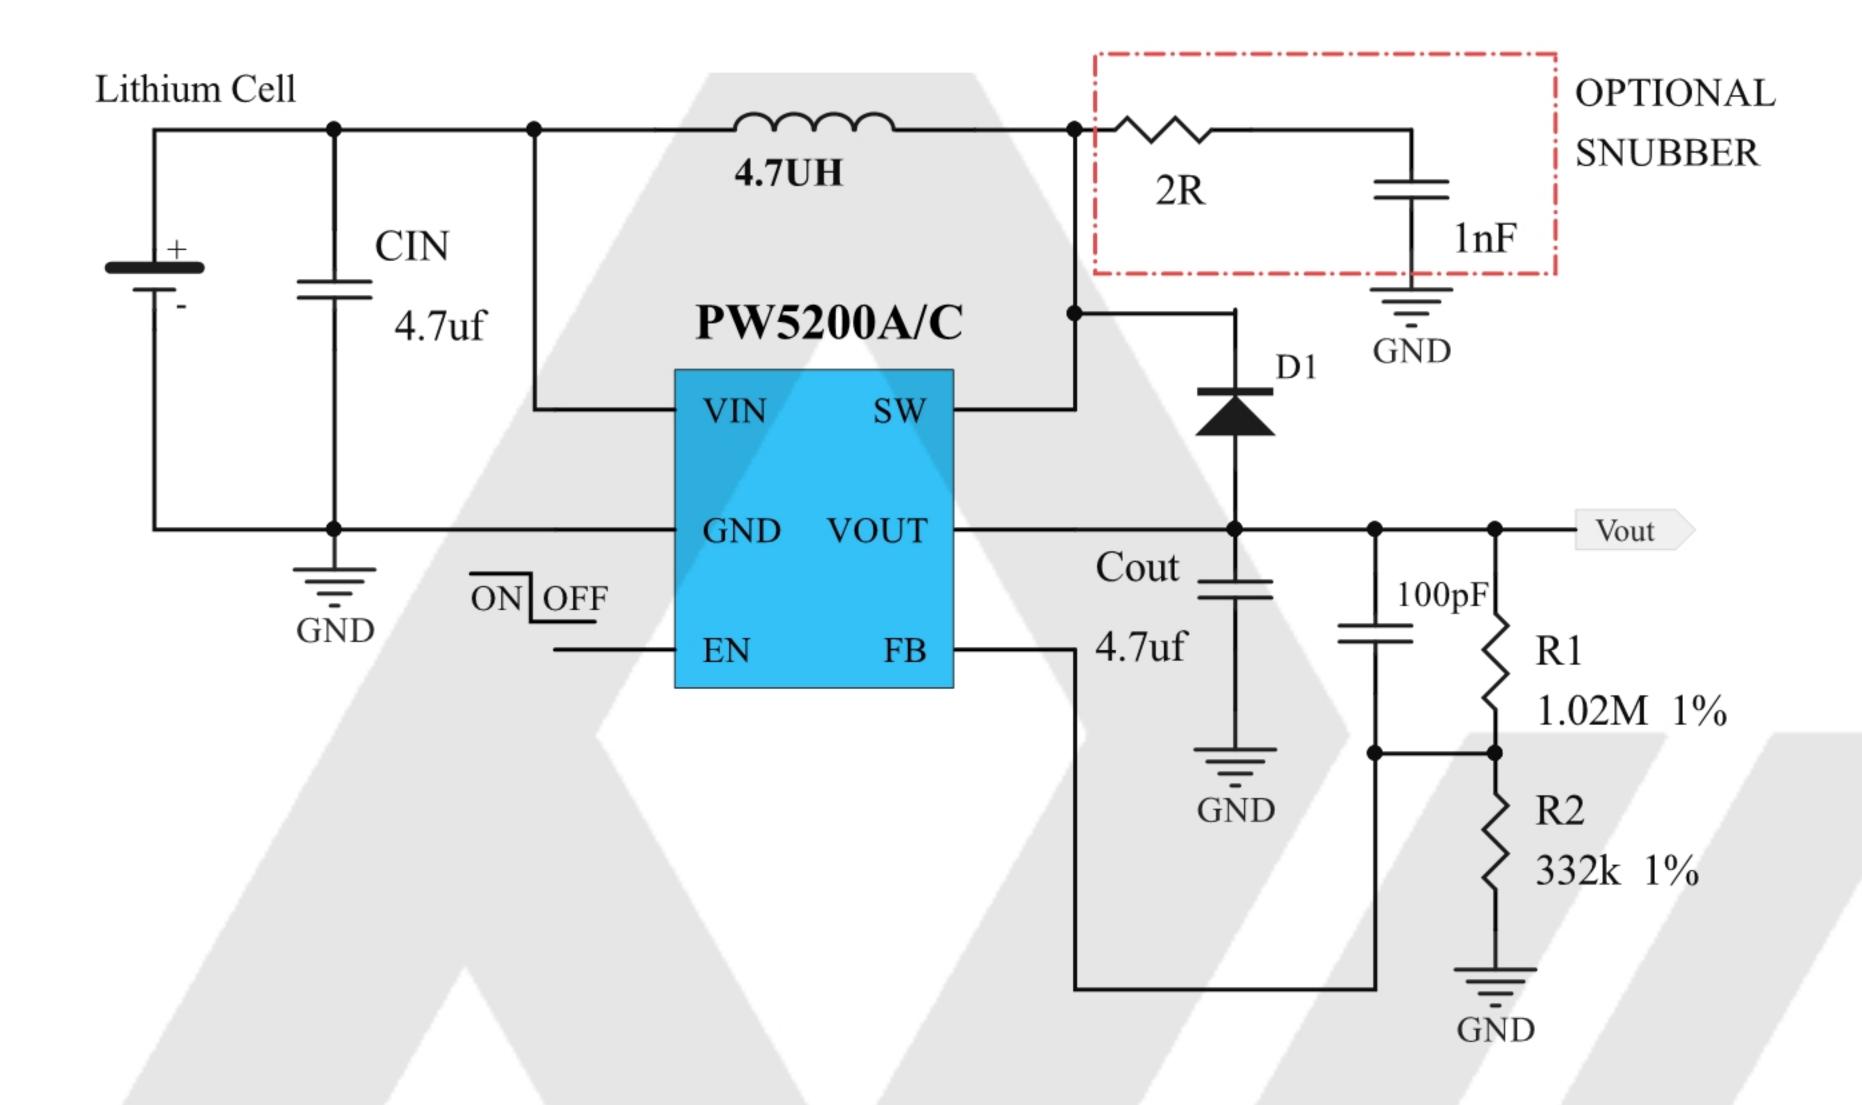

Low ESR input capacitors reduce input switching noise and reduce the peak current drawn from the battery. It follows that ceramic capacitors are also a good choice for input decoupling and should be located as close as possible to the device. A 10µF input capacitor is sufficient for virtually any application. Larger values may be used without limitations.

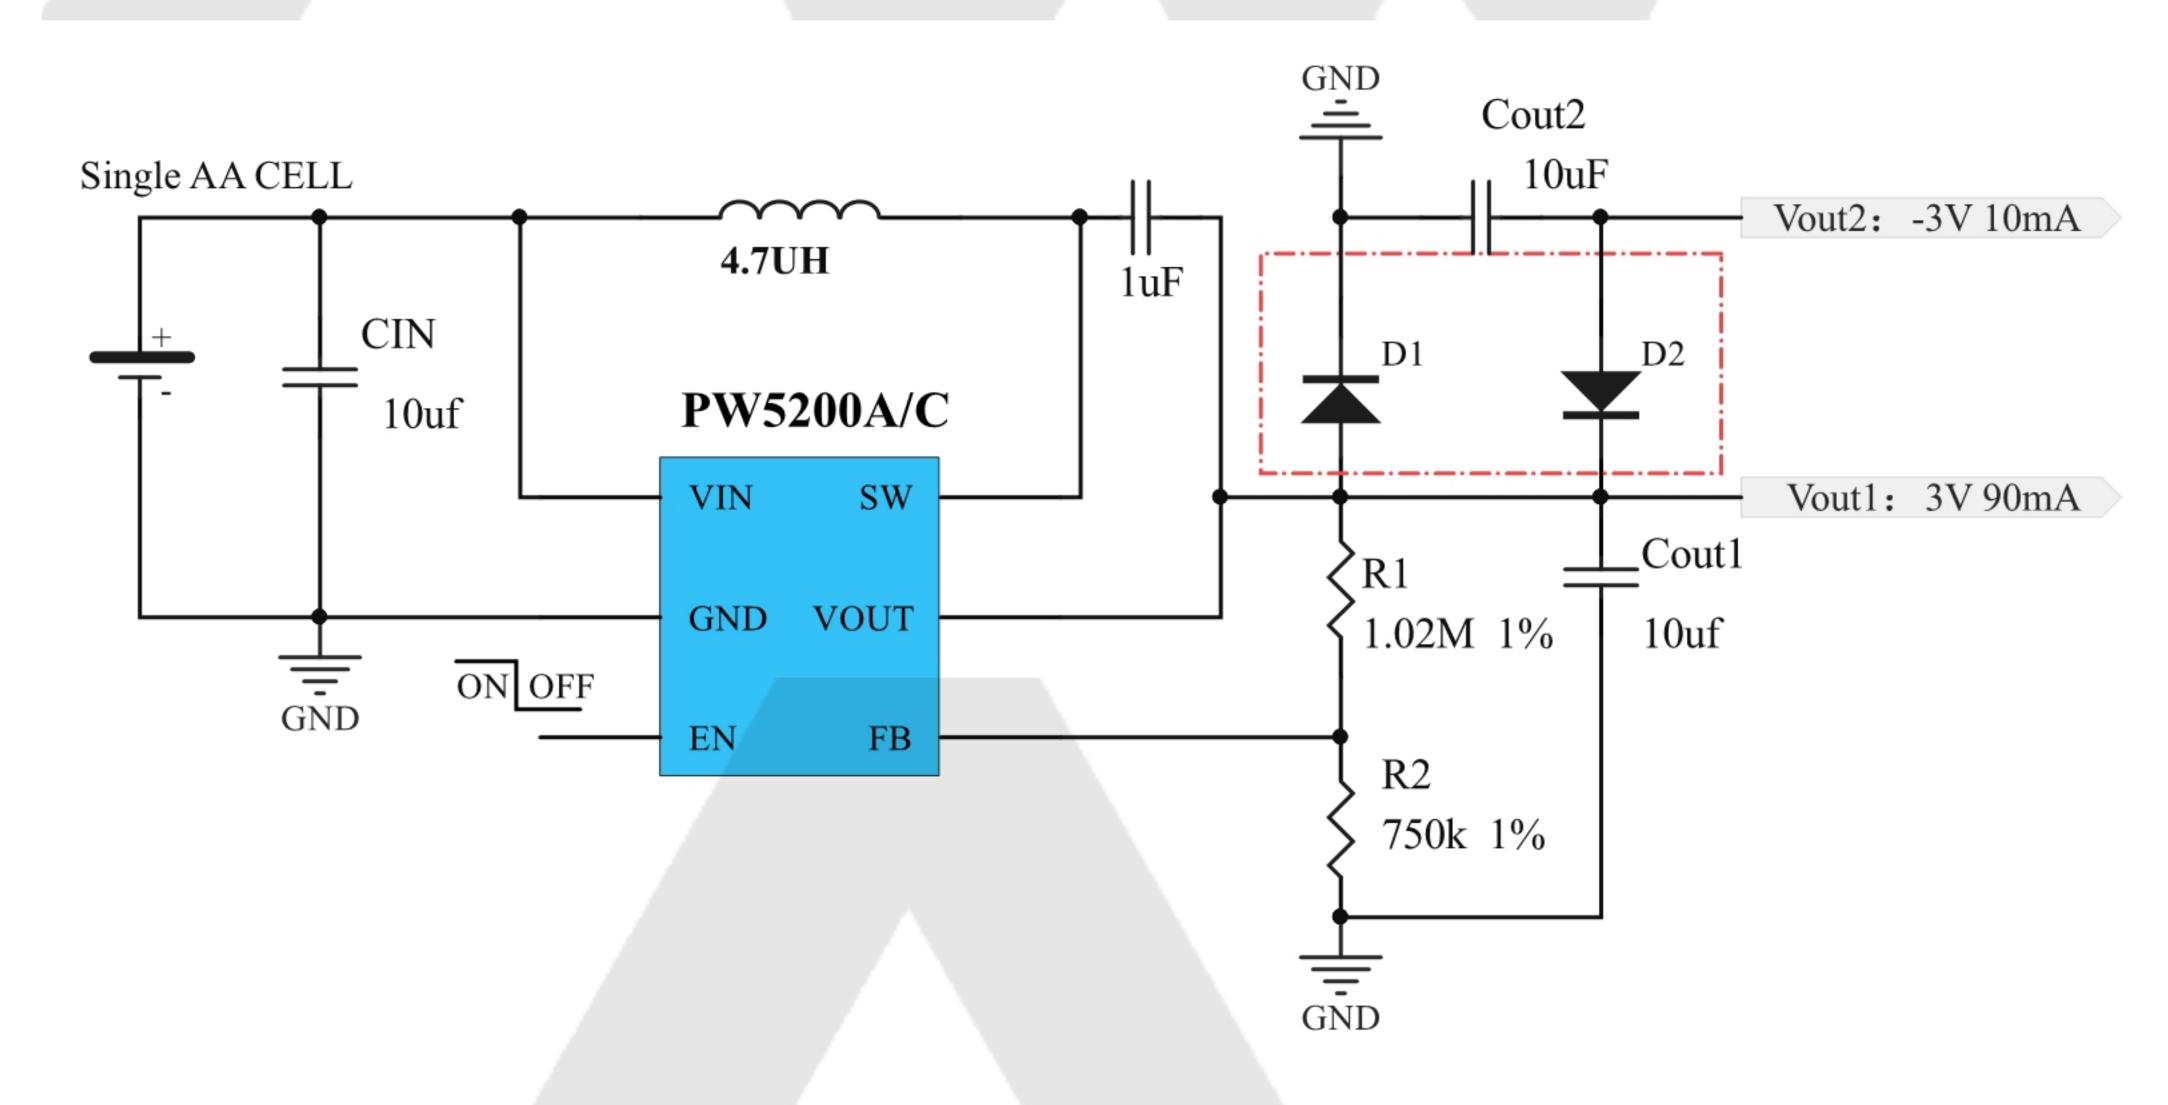

510K

Single Cell to 3.3V Synchronous Boost Converter with Load Disconnect in Shutdown.

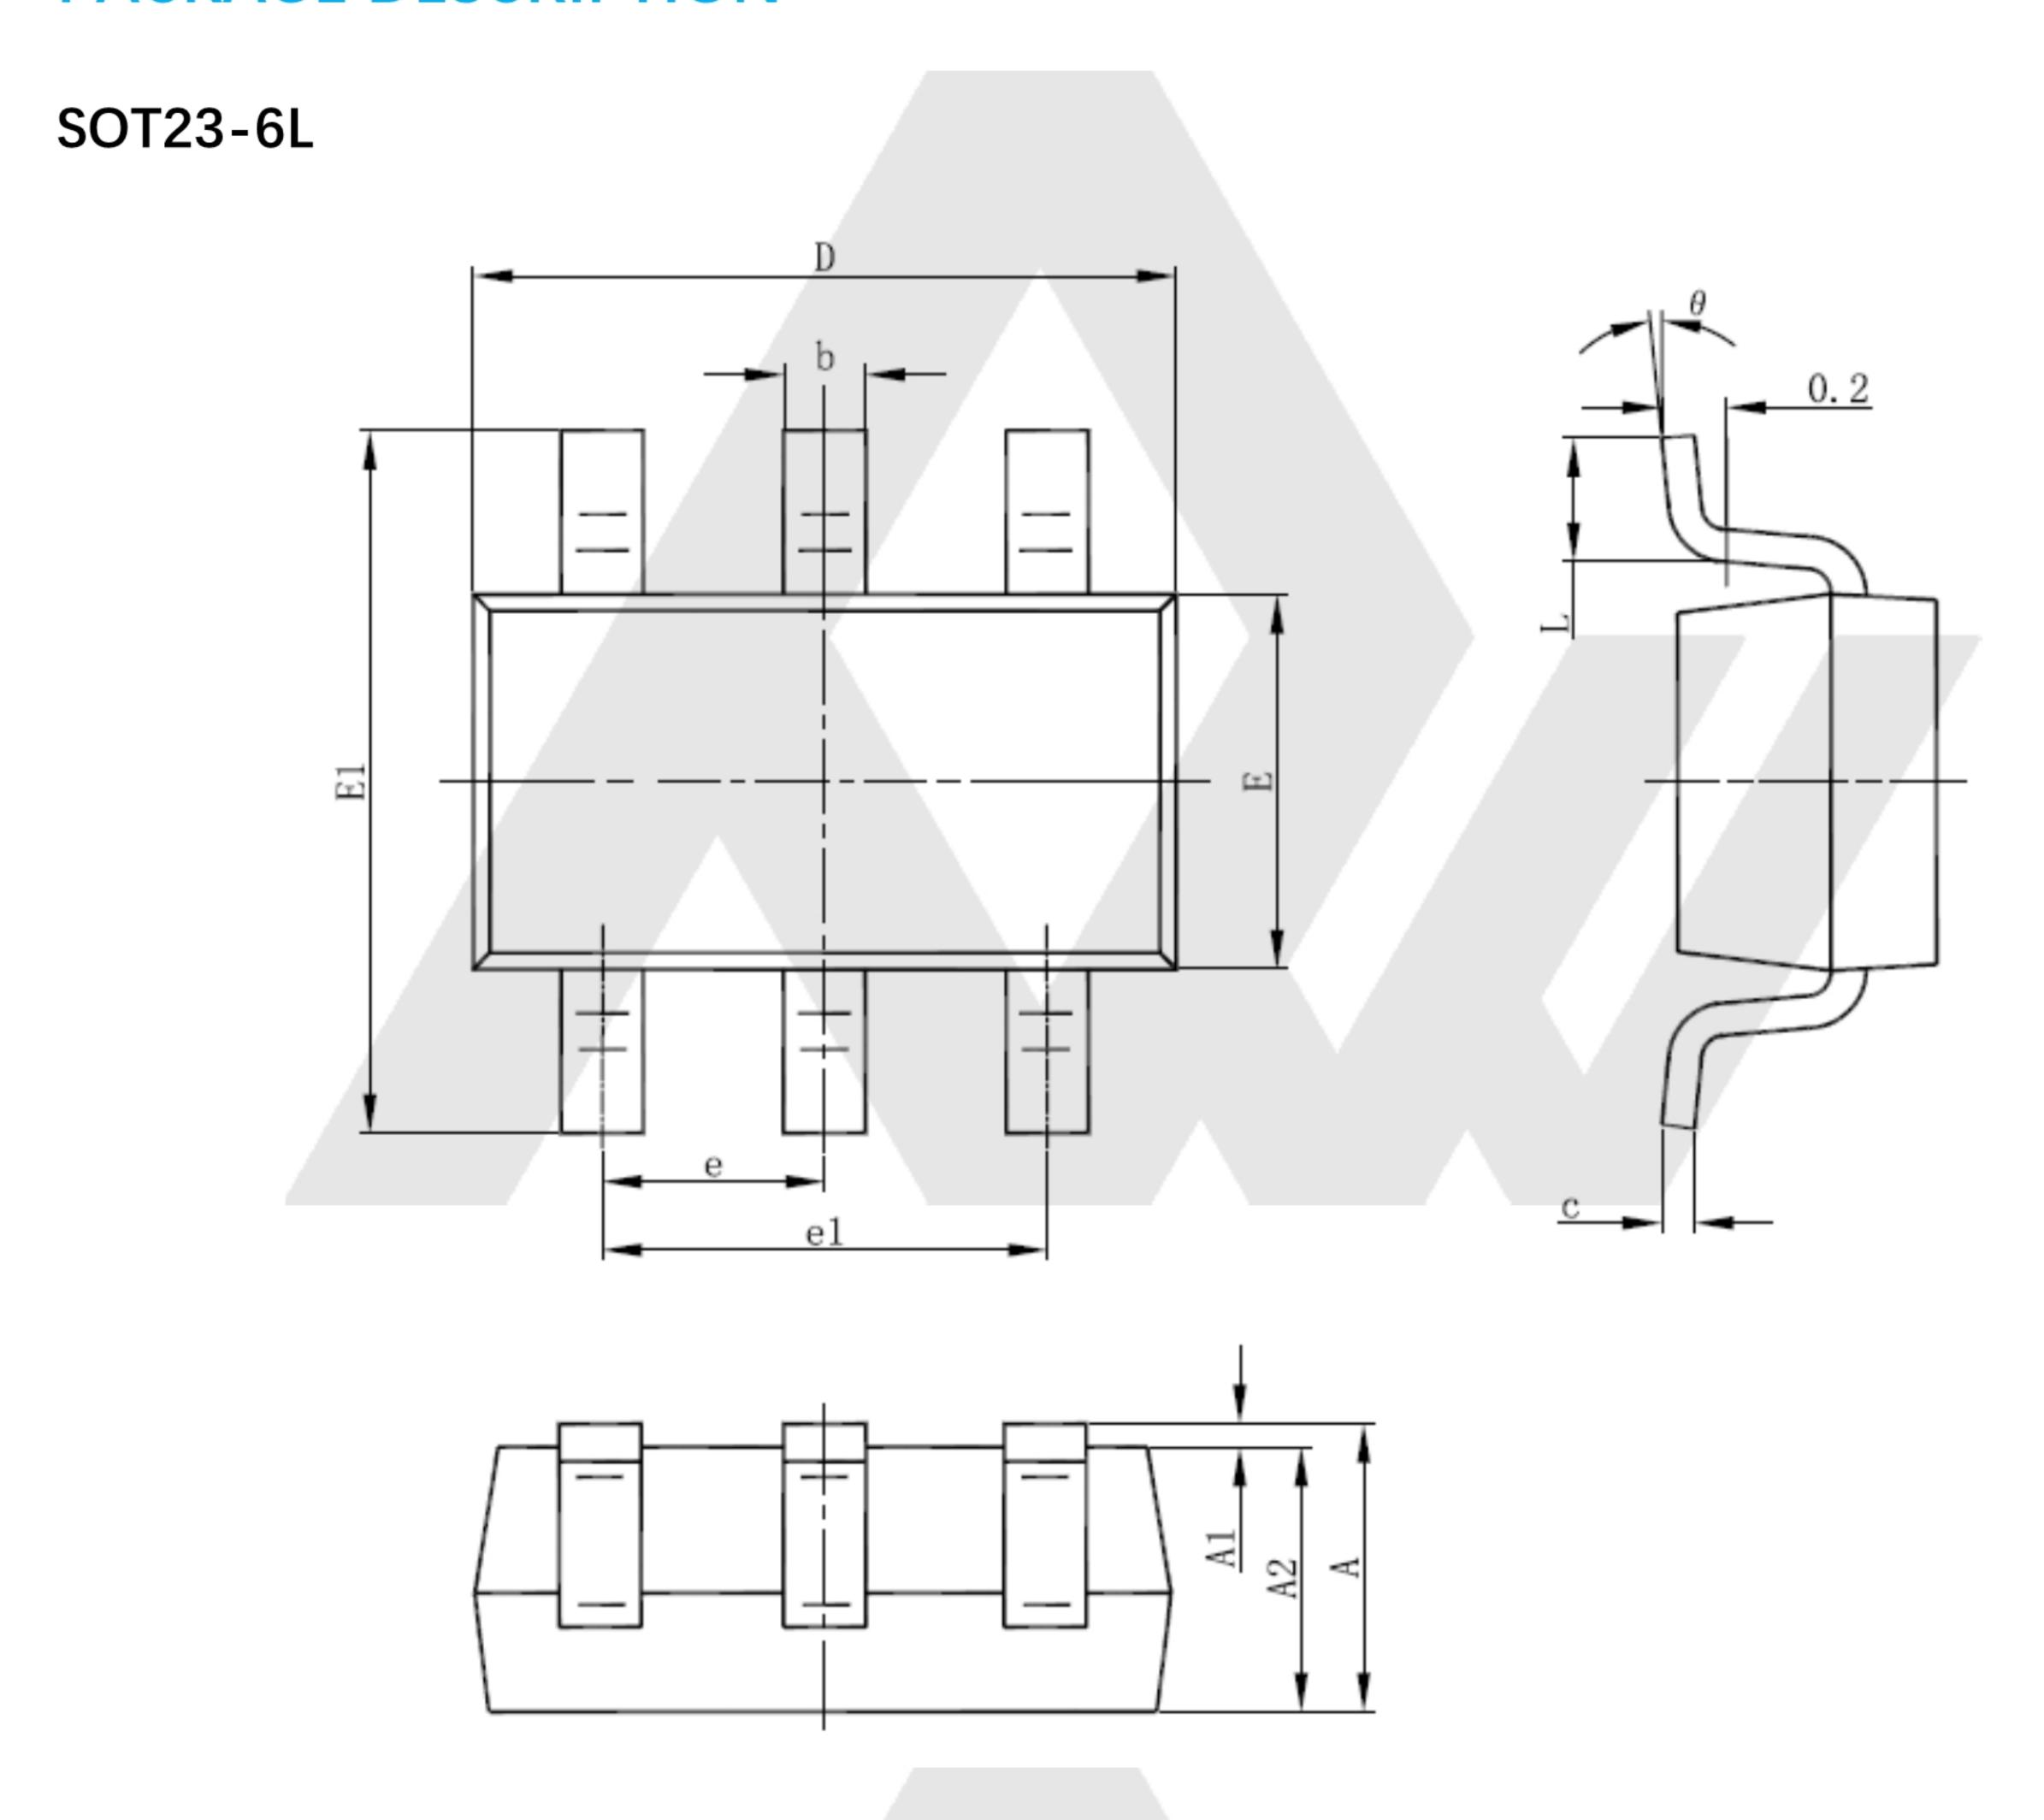

Single Lithium Cell to 5V with Load 250mA

Single Cell AA Cell to ±3V Synchronous Boost Converter
